FOR IMMEDIATE RELEASE:

G-COAT™ PLUS

December 15, 2006 - GC America is excited to announce G-Coat Plus, a new Nanofilled Self Adhesive Light Cured Protective Coating.

G-Coat Plus:

- Provides a clear glossy surface for composite resins, glass ionomers, Jacket crowns, veneers, and provisionals.
- Protects glass ionomer restorations against white spots and micro cracking caused by excessive water contamination during initial cure.
- Increases the wear resistance of restorations.
- Restores esthetic appearance and marginal integrity when used to repair the interface between restorations and marginal tooth structure.
- Can be cured with LED or Halogen lights.

"G-COAT PLUS contains an adhesive monomer not formulated into other esthetic protective coatings on the market. This monomer provides excellent bond to all surfaces without the need for separate etching or bonding. Uniformly dispersed nanofillers in G-Coat Plus provide long lasting and even wear resistance across the restorative surface for a more natural appearance" said Dr. Robert Lee, Director of Marketing, GC America Inc. "G-Coat Plus provides a high gloss finish with one application right after shaping, saving clinicians valuable time by replacing multiple polishing steps. Additionally, G-Coat Plus seals the interface between tooth structure and restorative material protecting and extending the life of a restoration."

G-Coat Plus is available January 1, 2007 from GC Authorized Dental Dealers.

GC Corporation is celebrating 85 years of bringing exciting new biocompatible and environmentally friendly products with unequaled levels of quality to the professional community.
